

MOBMAS

- A Methodology For

Ontology-Based Multi-Agent Systems

Development

CERTIFICATE OF ORIGINALITY

I hereby declare that this submission is my own work and to the best of my knowledge it contains no material previously published or written by another person, nor material which to a substantial extent has been accepted for the award of any other degree or diploma at The University of New South Wales or any other educational institution, except where due acknowledgement is made in the thesis. Any contribution made to the research by others, with whom I have worked at The University of New South Wales or elsewhere, is explicitly acknowledged in the thesis.

I also declare that the intellectual content of this thesis is the product of my own work, except to the extent that assistance from others in the project's design and conception or in style, presentation and linguistic expression is acknowledged.

Quynh Nhu Tran

ABSTRACT

“Agent-based systems are one of the most vibrant and important areas of research and development to have emerged in information technology in the 1990s” (Luck et al. 2003). The use of agents as a metaphor for designing and constructing software systems represents an innovative movement in the field of software engineering: “*Agent-Oriented Software Engineering* (AOSE)” (Lind 2000; Luck et al. 2003).

This research contributes to the evolution of AOSE by proposing a *comprehensive ontology-based methodology for the analysis and design of Multi-Agent Systems* (MAS). The methodology is named **MOBMAS**, which stands for “**Methodology for Ontology-Based MASs**”. A major improvement of MOBMAS over the existing agent-oriented MAS development methodologies is its explicit and extensive **support for ontology-based MAS development**. Ontologies have been widely acknowledged for their significant benefits to interoperability, reusability, MAS development activities (such as system analysis and agent knowledge modelling) and MAS operation (such as agent communication and reasoning). Recognising these desirable ontology’s benefits, MOBMAS endeavours to identify and implement the various ways in which ontologies can be used in the *MAS development process* and integrated into the *MAS model definitions*. In so doing, MOBMAS has exploited ontologies to enhance its *MAS development process* and *MAS development product* with various strengths. These strengths include those ontology’s benefits listed above, and those additional benefits uncovered by MOBMAS, e.g. support for verification and validation, extendibility, maintainability and reliability. Compared to the numerous existing agent-oriented methodologies, MOBMAS is the first that explicitly and extensively investigates the diverse potential advantages of ontologies in MAS development, and which is able to implement these potential advantages via an ontology-based MAS development process and a set of ontology-based MAS model definitions.

Another major contribution of MOBMAS to the field of AOSE is its ability to address all key concerns of MAS development in one methodological framework. The methodology provides support for a comprehensive list of methodological requirements,

which are important to agent-oriented analysis and design, but which may not be well-supported by the current methodologies. These methodological requirements were identified and validated by this research from three sources: the existing agent-oriented methodologies, the existing evaluation frameworks for agent-oriented methodologies and conventional system development methodologies, and a survey of practitioners and researchers in the field of AOSE. MOBMAS supports the identified methodological requirements by combining the strengths of the existing agent-oriented methodologies (i.e. by reusing and enhancing the various strong techniques and model definitions of the existing methodologies where appropriate), and by proposing new techniques and model definitions where necessary.

The process of developing MOBMAS consisted of three sequential research activities. The first activity *identified and validated a list of methodological requirements for an Agent Oriented Software Engineering methodology* as mentioned above. The second research activity *developed MOBMAS* by specifying a development process, a set of techniques and a set of model definitions for supporting the identified methodological requirements. The final research activity *evaluated and refined MOBMAS* by collecting expert reviews on the methodology, using the methodology on an application and conducting a feature analysis of the methodology.

ACKNOWLEDGEMENTS

First and foremost, I wish to express my deepest gratitude to Prof. Graham Low, my supervisor of this PhD dissertation, for his valuable guidance and dedication to every stage of my research. It can be said that apart from myself, he is the one who has read my dissertation the most often. His meticulous comments on every page of my writing, and his enthusiastic attention to every step of my research, have resulted in significant corrections and improvements to my work. His devotion is sincerely appreciated.

I also wish to express special thanks to Prof. Mary-Anne Williams for her wholehearted support at various important stages of my research. I am thankful especially for her valuable help in finding the topic for my research, advertising for my survey, reviewing MOBMA and offering important suggestions for improvement.

I am very much indebted to Dr. Ghassan Beydoun for his generous devotion of time and effort to review my dissertation. His insightful advices have helped to notably improve the dissertation's coherence and completeness. I also sincerely thank Prof. Brian Henderson-Sellers and Dr. Cesar Gonzalez-Perez for their enthusiastic and dedicated involvement in the evaluation of MOBMA. Their constructive criticisms were truly valuable to the methodology. It is with much gratitude that I thank Mr. (soon to be Dr.) Vincent Pang for the countless times when he offered his generous support and assistance to me during my research, including his help with the binding of this thesis.

My appreciation extends to the Faculty of Economics and Commerce at The University of New South Wales, who awarded me the "Faculty Postgraduate Research Scholarship". Without its financial support, this research would not have been possible.

Last but not least, I am forever thankful to my mother Tuyet Anh Thi Duong, my father Nam Duc Tran and my sister Dr. Giao Quynh Tran for their never-ending and immeasurable love, understanding and support. Above all, I am truly grateful to God for His amazing grace and everything that He has blessed me, including the blessing of the most wonderful mother and father that I have. This dissertation is dedicated to them.

Table AppendixD.4 – Support for steps of GAIA.....	396
Table AppendixD.5 – Support for steps of MESSAGE.....	397
Table AppendixD.6 – Support for steps of INGENIAS.....	398
Table AppendixD.7 – Support for steps of BDIM	399
Table AppendixD.8 – Support for steps of HLIM.....	400
Table AppendixD.9 – Support for steps of MEI	401
Table AppendixD.10 – Support for steps of PROMETHEUS.....	402

Table AppendixD.11 – Support for steps of PASSI	403
Table AppendixD.12 – Support for steps of ADELFE	404
Table AppendixD.13 – Support for steps of COMOMAS	405
Table AppendixD.14 – Support for steps of MAS-CommonKADS	406
Table AppendixD.15 – Support for steps of CASSIOPEIA	408
Table AppendixD.16 – Support for steps of TROPOS	409

LIST OF ABBREVIATIONS

ACL	Agent Communication Language
AOSE	Agent-Oriented Software Engineering
BDI	Belief-Desire-Intention agent architecture
BDIM	Methodology for BDI agents
HLIM	Methodology with High-Level and Intermediate levels
MAS	Multi-Agent System
MEI	Methodology for Enterprise Integration
OCL	Object Constraint Language
OO	Object Oriented
P2P	Peer to peer
PC	Program Committee
SDLC	System Development Lifecycle
UML	Unified Modelling Language
UCM	Use Case Map
